

Enjoy Accessibility and Security with Mobility as a Service

Cloud based mobility as a service wireless technology is about to surpass LAN based hardwired technology as the new business standard for IT networks. Mobility as a service is shattering physical IT boundaries, and any company that hopes to stay competitive knows that it has to keep in step with start of the art IT developments or risk being left behind. This new paradigm also generates huge infrastructure maintenance costs by eliminating the need for physical IT hardware and provides companies with superior endpoint control features for its remote units.

Mobility as a service capitalizes on new cloud based technology to provide a mobility platform for your remote workforce. Connectivity and security are never an issue with mobility as a service, as this platform allows workers immediate and reliable real time access to all their network applications and data just as though they were back at the office. Your business, in turn, benefits from mobility as a service control over user endpoints (i.e., laptops and handhelds) and data to ensure compliance with company network policies by those employees.

As businesses become global, so does the workforce. Employees out in the field now require immediate and around the clock access to their company networks from wherever they may be. Mobility as a service will keep them connected to all their data and applications without risk to network security. Workers will find alternate ways to connect with their applications and data if companies do not provide them with a safe way to do so, putting their networks at great risk. Avoid attracting trouble by switching to a mobility as a service platform.

Do not forget that workers everywhere are placing more importance on a better work life balance. Attracting good talent in the 21st Century means offering employees choices in work environment; mobility as a service is the answer. Morale will skyrocket if employees, particularly those with young children, are given the opportunity to work from home. The freedom to work from home translates to fewer missed work days, when employees have the flexibility to take time out of their day to watch sick children or transport them to the doctor. Employers are comforted by the fact that mobility as a service gives them the ability to monitor their remote workforce to confirm that that workforce is actually putting in a full days worth of work (regardless of how hours are apportioned) and that it remains in compliance with company network policies.
