

Does car wax actually work

Car wax is a protective coating applied to the external coat of the automobile so as to prevent oxidation. The protective layer formed by the car wax is only enough to save the paint from oxidation and it cannot form complete protection from all damage, such as bird droppings and scratches from heavy objects. Car wax also gives your vehicle a natural shine and saves it from harsh environment.

Waxing a car helps in forming a protective layer over the car which gives it great protection. This layer helps in covering minor scratches and stone chips by making them less visible. Car wax also reduces corrosion due to water as it forms a seal on the pain through which water cannot enter. Car wax is not a permanent application and needs to be reapplied regularly for best results. A good quality car wax generally stays on for around 3 to 4 months thus reapplication of car wax every 3 months would be optimum.

IT is advisable that before waxing a car it should be buffered for any irregularities and to remove scratches, after which the wax should be applied, which is repeated every three months. The essentials to start waxing your car is wax, a clean soft towel and a small sponge. Ensure that you car is clean and dry before you initiate the process of waxing your car. Be careful as to take a non abrasive car wax so as to not damage your car. Advisably you should go through directions provided on the package itself and test the wax on a small area first so as to check if it is right for your car.

While using liquid car wax, first shake the bottle well, and put small amount of the wax on the sponge to apply evenly on the car. A general approach is to start with the top and move the bottom panels subsequently as it is known that the bottom panels of a car are always dirtier. it is preferable to make a thin and even layer all over the car and thick layers should be avoided as due to that the shine is lost. Waxing any other part other than the painted metal part is not a good idea as it will leave a white mark all over the rubber or glass parts.

After letting the car wax be for a minute or two, buff it with a cloth which will give it a nice natural shine. Waxing the car is considered very beneficial in the long run as it helps in reducing scratches and gives the car a nice shiny lustre. Related articles [" title=" ">Automobile |](#)
